

## UNIT II **DIVIDE-AND-CONQUER**

Divide and Conquer Methodology – Binary Search –  
**Merge Sort** – Quick Sort – Heap Sort – Multiplication  
of Large Integers – Strassen's Matrix Multiplication

# Mergesort

- Split array  $A[0..n-1]$  into about equal halves and make copies of each half in arrays B and C
- Sort arrays B and C recursively
- Merge sorted arrays B and C into array A as follows:
  - Repeat the following until no elements remain in one of the arrays:
    - compare the first elements in the remaining unprocessed portions of the arrays
    - copy the smaller of the two into A, while incrementing the index indicating the unprocessed portion of that array
  - Once all elements in one of the arrays are processed, copy the remaining unprocessed elements from the other array into A.

# Pseudocode of Mergesort

**ALGORITHM** *Mergesort*( $A[0..n - 1]$ )

//Sorts array  $A[0..n - 1]$  by recursive mergesort

//Input: An array  $A[0..n - 1]$  of orderable elements

//Output: Array  $A[0..n - 1]$  sorted in nondecreasing order

**if**  $n > 1$

    copy  $A[0..\lfloor n/2 \rfloor - 1]$  to  $B[0..\lfloor n/2 \rfloor - 1]$

    copy  $A[\lfloor n/2 \rfloor..n - 1]$  to  $C[0..\lceil n/2 \rceil - 1]$

*Mergesort*( $B[0..\lfloor n/2 \rfloor - 1]$ )

*Mergesort*( $C[0..\lceil n/2 \rceil - 1]$ )

*Merge*( $B, C, A$ )

## Pseudocode of Merge

**ALGORITHM** *Merge*( $B[0..p-1]$ ,  $C[0..q-1]$ ,  $A[0..p+q-1]$ )

//Merges two sorted arrays into one sorted array

//Input: Arrays  $B[0..p-1]$  and  $C[0..q-1]$  both sorted

//Output: Sorted array  $A[0..p+q-1]$  of the elements of  $B$  and  $C$

$i \leftarrow 0$ ;  $j \leftarrow 0$ ;  $k \leftarrow 0$

**while**  $i < p$  **and**  $j < q$  **do**

**if**  $B[i] \leq C[j]$

$A[k] \leftarrow B[i]$ ;  $i \leftarrow i + 1$

**else**  $A[k] \leftarrow C[j]$ ;  $j \leftarrow j + 1$

$k \leftarrow k + 1$

**if**  $i = p$

    copy  $C[j..q-1]$  to  $A[k..p+q-1]$

**else** copy  $B[i..p-1]$  to  $A[k..p+q-1]$

Time complexity:  $\Theta(p+q) = \Theta(n)$  comparisons

# Mergesort Example

The non-recursive version of Merge Sort starts from merging single elements into sorted pairs.

## Analysis of Mergesort

- All cases have same efficiency:  $\Theta(n \log n)$

$$T(n) = 2T(n/2) + \Theta(n), T(1) = 0$$

- Number of comparisons in the worst case is close to theoretical minimum for comparison-based sorting:

$$\lceil \log_2 n! \rceil \approx n \log_2 n - 1.44n$$

- Space requirement:  $\Theta(n)$  (not in-place)
- Can be implemented without recursion (bottom-up)

Thank You
